

Amendments to the Claims:

Please amend claims 1 and 19. Following is a complete listing of the claims pending in the application, as amended:

1. (Currently amended) An apparatus for handling an unmanned aircraft, comprising:

a support structure having a first portion and a second portion, at least one of the first and second portions being ~~movable~~ axially extendable relative to the other between a first position and a second position;

a flexible recovery line carried by the second portion of the support structure, wherein the recovery line is spaced apart from a point on the first portion of the support structure by a first distance when the at least one of the first and second portions is in the first position, and wherein the recovery line is spaced apart from the point on the first portion of the support structure by a second distance greater than the first distance when the at least one of the first and second portions is in the second position; and

an axially extendable resilient member coupled to the recovery line, the resilient member being positioned to extend when tension is applied to the recovery line and retract when the tension is reduced.

2. (Original) The apparatus of claim 1 wherein the support structure includes an extendable boom, and wherein the first position is a retracted position and the second position is an extended position.

3. (Original) The apparatus of claim wherein the support structure includes an extendable boom, with the at least one of the first and second portions being telescopically received in the other portion.

4. (Original) The apparatus of claim 1 wherein the axially extendable resilient member includes a spring.

5. (Original) The apparatus of claim 1 wherein the flexible recovery line is configured to capture an unmanned aircraft in flight.

6. (Original) The apparatus of claim 1, further comprising a rotatable base, wherein the support structure is pivotally attached to the rotatable base.

7. (Original) The apparatus of claim 1 wherein the flexible recovery line is suspendable from the second portion of the support structure to hang at least generally downward.

8. (Original) The apparatus of claim 1 wherein the flexible recovery line is suspendable from the second portion of the support structure, the flexible recovery line having a first recovery line portion hanging generally downward and a second recovery line portion attachable to a point on the support structure.

9. (Original) The apparatus of claim 1, further comprising an unmanned aircraft having a lifting surface and a capture device mounted to the lifting surface, the capture device being configured to releasably secure the aircraft to the recovery line when the aircraft intercepts the recovery line.

10. (Original) The apparatus of claim 1, further comprising a retrieval line operatively coupled to the recovery line, wherein the retrieval line is positioned to at least partially control motion of the recovery line.

11. (Original) The apparatus of claim 1 wherein the support structure is configured to carry both a lateral load and a vertical load via the recovery line.

12. (Previously presented) An apparatus for handling an unmanned aircraft, comprising:

- an extendable boom, the boom having a proximal end and a distal end spaced apart from the proximal end, wherein the boom is extendable along a longitudinal axis from a retracted position to an extended position;
- a flexible recovery line suspendable from the boom when the boom is in the extended position, the recovery line being movable between a retracted position and a deployed position, wherein the recovery line in the deployed position extends at least generally downward; and
- an axially extendable resilient member coupled to the recovery line, the resilient member being positioned to extend when tension is applied to the recovery line and retract when the tension is reduced.

13. (Original) The apparatus of claim 12 wherein the extendable boom includes a first segment and a second segment, with the at least one of the first and second segments being movable relative to the other as the extendable boom moves along the longitudinal axis between the retracted position and the extended position.

14. (Original) The apparatus of claim 12 wherein the flexible recovery line is configured to capture an unmanned aircraft in flight.

15. (Original) The apparatus of claim 12, further comprising a rotatable base, wherein the extendable boom is pivotally attached to the rotatable base.

16. (Original) The apparatus of claim 12, further comprising an unmanned aircraft having a lifting surface and a capture device mounted to the lifting surface, the capture device being configured to releasably secure the aircraft to the recovery line when the aircraft intercepts the recovery line.

17. (Original) The apparatus of claim 12, further comprising a retrieval line operatively coupled to the recovery line, wherein the retrieval line is positioned to at least partially control motion of the recovery line.

18. (Original) The apparatus of claim 12 wherein the support structure is configured to carry both a lateral load and a vertical load via the recovery line.

19. (Currently amended) An apparatus for handling an unmanned aircraft, comprising:

support means having a first portion and a second portion, at least one of the first and second portions being ~~movable~~ axially extendable relative to the other between a first position and a second position;

recovery means for intercepting and capturing an unmanned aircraft in flight, wherein the recovery means is carried by the support means; and

tension means operatively coupled to the recovery means, wherein the tension means is configured extend when tension is applied to the recovery line and retract when the tension is reduced.

20. (Original) The apparatus of claim 19 wherein the support means includes an extendable boom, with the at least one of the first and second portions being movable relative to the other on a longitudinal axis extending along the boom between the first position and the second position, and wherein the first position is a retracted position and the second position is an extended position.

21. (Original) The apparatus of claim 19 wherein the recovery means includes a flexible recovery line suspendable from the support means when the support means is in the second position.

22. (Original) The apparatus of claim 19 wherein the tension means includes a spring operatively coupled to the recovery means.

23. (Previously presented) A method for handling an unmanned aircraft, comprising:

moving a first portion of a single boom relative to a second portion of the single boom to increase the length of the single boom;
deploying a flexible recovery line from the single boom;
flying an unmanned aircraft to intercept the flexible recovery line in flight; and
releasably capturing the aircraft in flight with the recovery line.

24. (Previously presented) The method of claim 23 wherein the flexible recovery line is spaced apart from a point on the first portion of the single boom by a first distance when the at least one of the first and second portions of the single boom is in a first position, and wherein the recovery line is spaced apart from the point on the first portion of the single boom by a second distance greater than the first distance when the at least one of the first and second portions of the single boom is in a second position.

25. (Original) The method of claim 23 wherein the aircraft includes a wing, and wherein capturing the aircraft includes releasably securing the wing to the recovery line.

26. (Original) The method of claim 23, further comprising applying tension to the flexible recovery line after deploying the recovery line and before releasably capturing the aircraft.

27. (Original) The method of claim 23, further comprising retrieving the aircraft from the recovery line after releasably capturing the aircraft.

28. (Previously presented) A method for handling an unmanned aircraft, comprising:

moving a first portion of a single extendable boom relative to a second portion of the single extendable boom to increase the length of the boom;

deploying a flexible recovery line from the second portion of the single extendable boom, wherein the recovery line is suspended at least generally in a downward direction from the boom;
flying an unmanned aircraft to intercept the flexible recovery line in flight;
releasably capturing the aircraft in flight with the recovery line; and
retrieving the aircraft from the flexible recovery line.

29. (Original) The method of claim 28 wherein the aircraft includes a wing, and wherein capturing the aircraft includes releasably securing the wing to the recovery line.

30. (Previously presented) The method of claim 28 wherein the at least one of the first and second portions of the single extendable boom are placed in a retracted position before retrieving the aircraft from the flexible recovery line.

31. (Original) The method of claim 28, further comprising applying tension to the flexible recovery line after deploying the recovery line and before capturing the aircraft.

32. (Original) The method of claim 28 wherein the method further comprises controlling the flexible recovery line with a retrieval line.

33. (Original) The method of claim 28, further comprising lengthening an extendable tension member coupled to the flexible recovery line when intercepting the aircraft with the flexible recovery line.
